

Theory: Time Machine (space and time)

Did you know that everything does not happen at once? We cannot help passing the time, to be on the other side of the world. Everything takes place in a time, not even light to travel long distances for the time and thence we find speed. Sun, we see it for 8 minutes before, as long as the light gets to Earth (150 million km) at a speed of 300,000 km / s. Also we see the distant past stars. But if we were near the stars we could see for a long time the exploded star. We have seen the future stars, as seen from the difference of land or proximity to the star, we would have seen different. While the explosion will reach land someone near the star will see it before. See the future stars of the object or if you can when you're as close as the star or object. Can I return time sleeping and jump into the future [I think so, and will tell as].

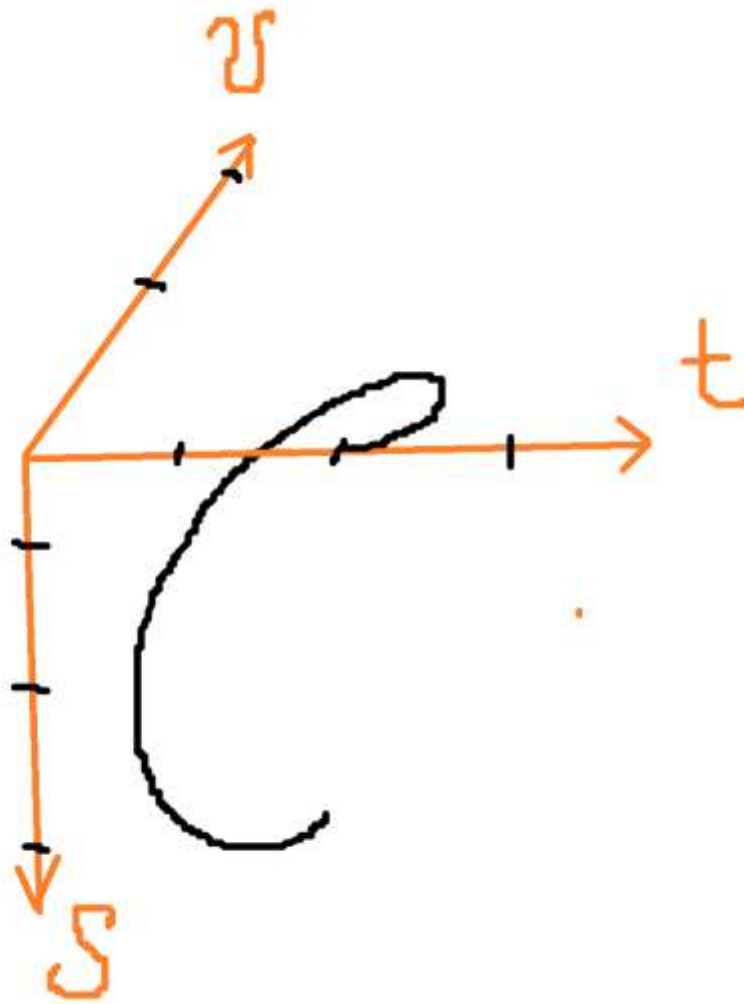

The more the younger, as we can see the past and the observed oldest shield ourselves. Earth itself. If we will fly away from the earth or the stars at the speed of light, time relative to the star or the ground stay as we are flying relatively light, we do not overtake, do not be late. Shield that the speed of light and have the time, but what we see, and for the sound that we too. But the most surprising that if at the time when we were leaving from the star, and ahead of us another star, then this star would have to go with respect to 2 times faster than the processes of time, as the light moves from opposite another light is the relative speed of 600 000 km / s .no time we have the most (in the ship) is not changed.

But if you fly faster than the speed of light from the ground, the time will go back, as we pass the light. It may seem a strange, but if for example: the flight was 12 o'clock in the morning and we dispersed 1:00 ship faster than the speed of light then goes back to the time when we returned an hour and even returned at 11 am, and until the ship was stopped for 1 hour, then we could really to see ourselves as we over clock ship and time is really the same, but cannot meet because you have overcome great distances, the schedule is as follows.

They would not be met because there is one more measure in the chart and it distances.

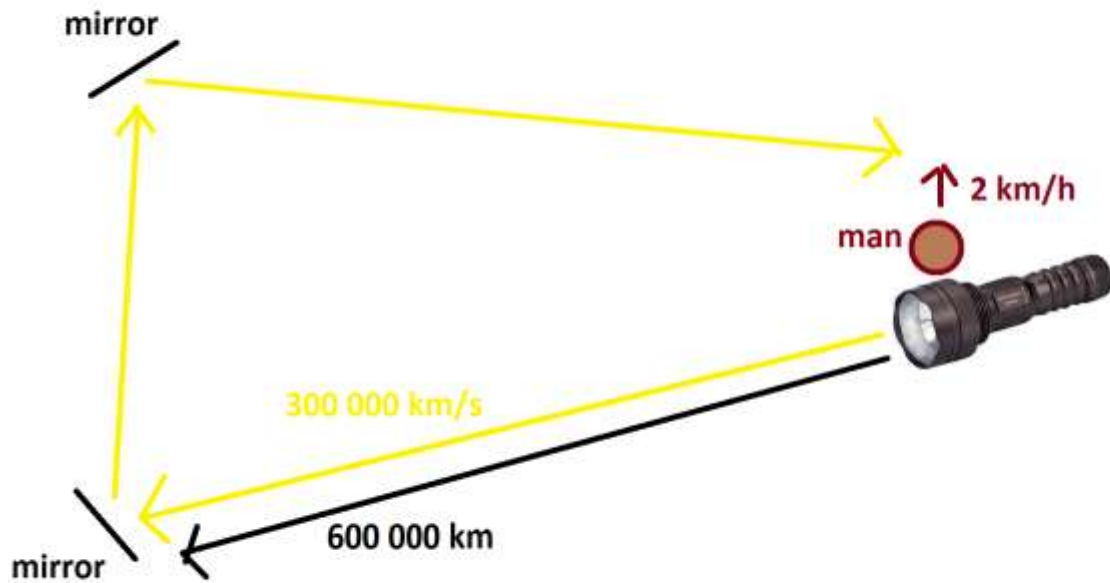

(Three dimensions in space)

But since it is impossible to travel faster than the speed of light, I have 2 ways how to make more real.

1) When an object is flying by us at light speed, and we fly at the speed of light, relative to the object will be time to go back.

2) If we are unable beat the light, it is necessary to do so that the light made extra work, that is, to deceive the world such as:

If we see the stars of the earth as they were 40,000 years old, the star is also evident from the land, if any aliens that look through a powerful telescope, he also sees as 40,000 years ago, for example, dinosaurs.
